

# Algorithm to select even/odd drawing method

- Compute the expected diameter of the circle from the number of tiles to draw as: Sqrt(4 \* tiles / π) rounded to closest integer
- If computed value is odd, draw an odd circle, if computed value is even, draw an even circle.

## Algorithm to select next tile in the sequence

- 1. Compute 4x<sup>2</sup> + 4y<sup>2</sup> values in the eighth of the plane where y>=0, x>=y
- 2. Select the lowest value with free space for tiles
- If several tiles have the same value, select the one closest to the top: highest v. then lowest x
- 4. After selecting a tile at position (x,y) in first quarter, select next distinct tiles found at symmetrical positions (-x,-y), (-x,y), (x,-y), (-y,-x), (-y,-x), (y,x) in this order:

	3: -x,y		1: x,y	
5: -y, x	NW	Ν	NE	8: y, x
7: -y, -x	SW	s	E SE	6: y, -x
	2: -x, -y		4: x, -y	

### Special cases

Center: (x=0, y=0), 1=2=3=4=5=6=7=8 Axes: x=0, y=0, x=y, x=-y

3=5	1=3	1=8
5=7	1==8	6=8
2=7	2=4	4=6

Algorithme pour agglomérer des carrés en formes circulaires
